

# *E. coli* monitoring in Upper Ohio River Valley streams

Emily Huff and James Wood

Department of Ecology, Organismal Biology, and Zoo Science, West  
Liberty University, West Liberty, WV, 26074

# Bacteria surface water contamination

- Sewer systems
  - Combined sewer overflows (CSOs)
- Failing infrastructure
- Wildlife

(RVAH20 2022)

# Pathogen contamination

- Number one cause of impairments for Clean Water Act 303(d) listed waters in the USA (Chen and Chang 2014)
- Stormwater is a major transporter of pathogens to surface waters (McLellan 2007)

# Fecal indicator bacteria

- Presence can indicate contamination
- Limitations
  - Many hosts
  - Unable to distinguish between sources

# *Escherichia coli*

- *Escherichia coli* - recognized as the best indicator of fecal contamination (Price & Wildeboer 2017)
- EPA safe limits
  - 235 CFU/100ml for single sample reading
  - 126 CFU/100ml for geometric mean 30-day period

# IDEXX Sampling Methods

- Surface grab 100 ml water sample from the middle of the channel
- Store on ice until returning to the lab
  - processed within 6 hours of samples taken
- A field bank is also transported as well to identify any cross contamination

# IDEXX Sampling Methods

- IDEXX Colilert is added to 100ml samples and dissolved
- Samples are poured into a 97 well IDEXX tray and sealed
- Samples are incubated at 37°C for 24 hours
  - Yellow wells = fecal coliforms
  - Fluorescing wells = *E. coli*

# Our Studies

- Started broad
  - Looking at the Wheeling Creek watershed

# Wheeling Creek Watershed

- 5<sup>th</sup> order stream
- 25 active CSO outfalls
- Old infrastructure, mining, development
- Upper portion affected by agriculture
- Impaired by fecal material inputs

# Wheeling Creek Study

upstream

downstream

# Our Studies

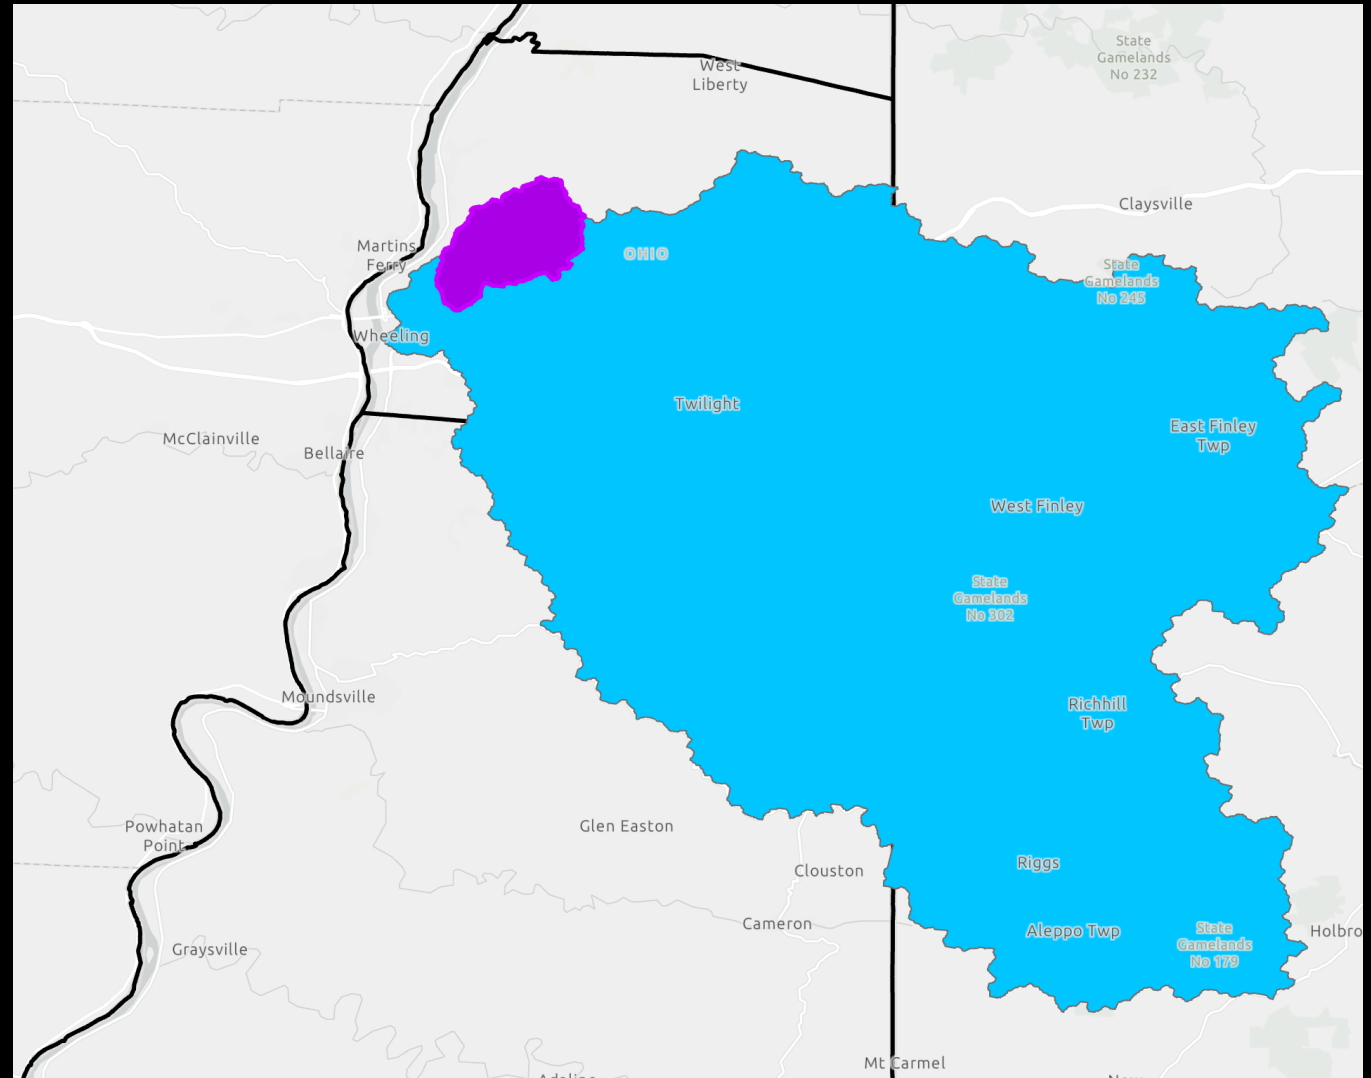

- Started broad
  - Looking at the Wheeling Creek watershed
- Focused in on the Long Run watershed
  - Tributary contributing notable *E. coli* loads

# Long Run Watershed

- 1<sup>st</sup> order stream
- Heavily urbanized
- Extensive deer population
- Impaired by fecal material inputs

# Long Run sites

- 24 sampling sites
- June 2023 – August 2023
- 9 sampling points
- Sampled during dry weather conditions
  - After 72 hours of no rain

# Long Run *E. coli* concentrations

# Our Studies

- Started broad
  - Looking at the Wheeling Creek watershed
- Focused in on the Long Run watershed
  - Tributary contributing notable *E. coli* loads
- Finer focus on a smaller geographic area
  - Orchard run stream

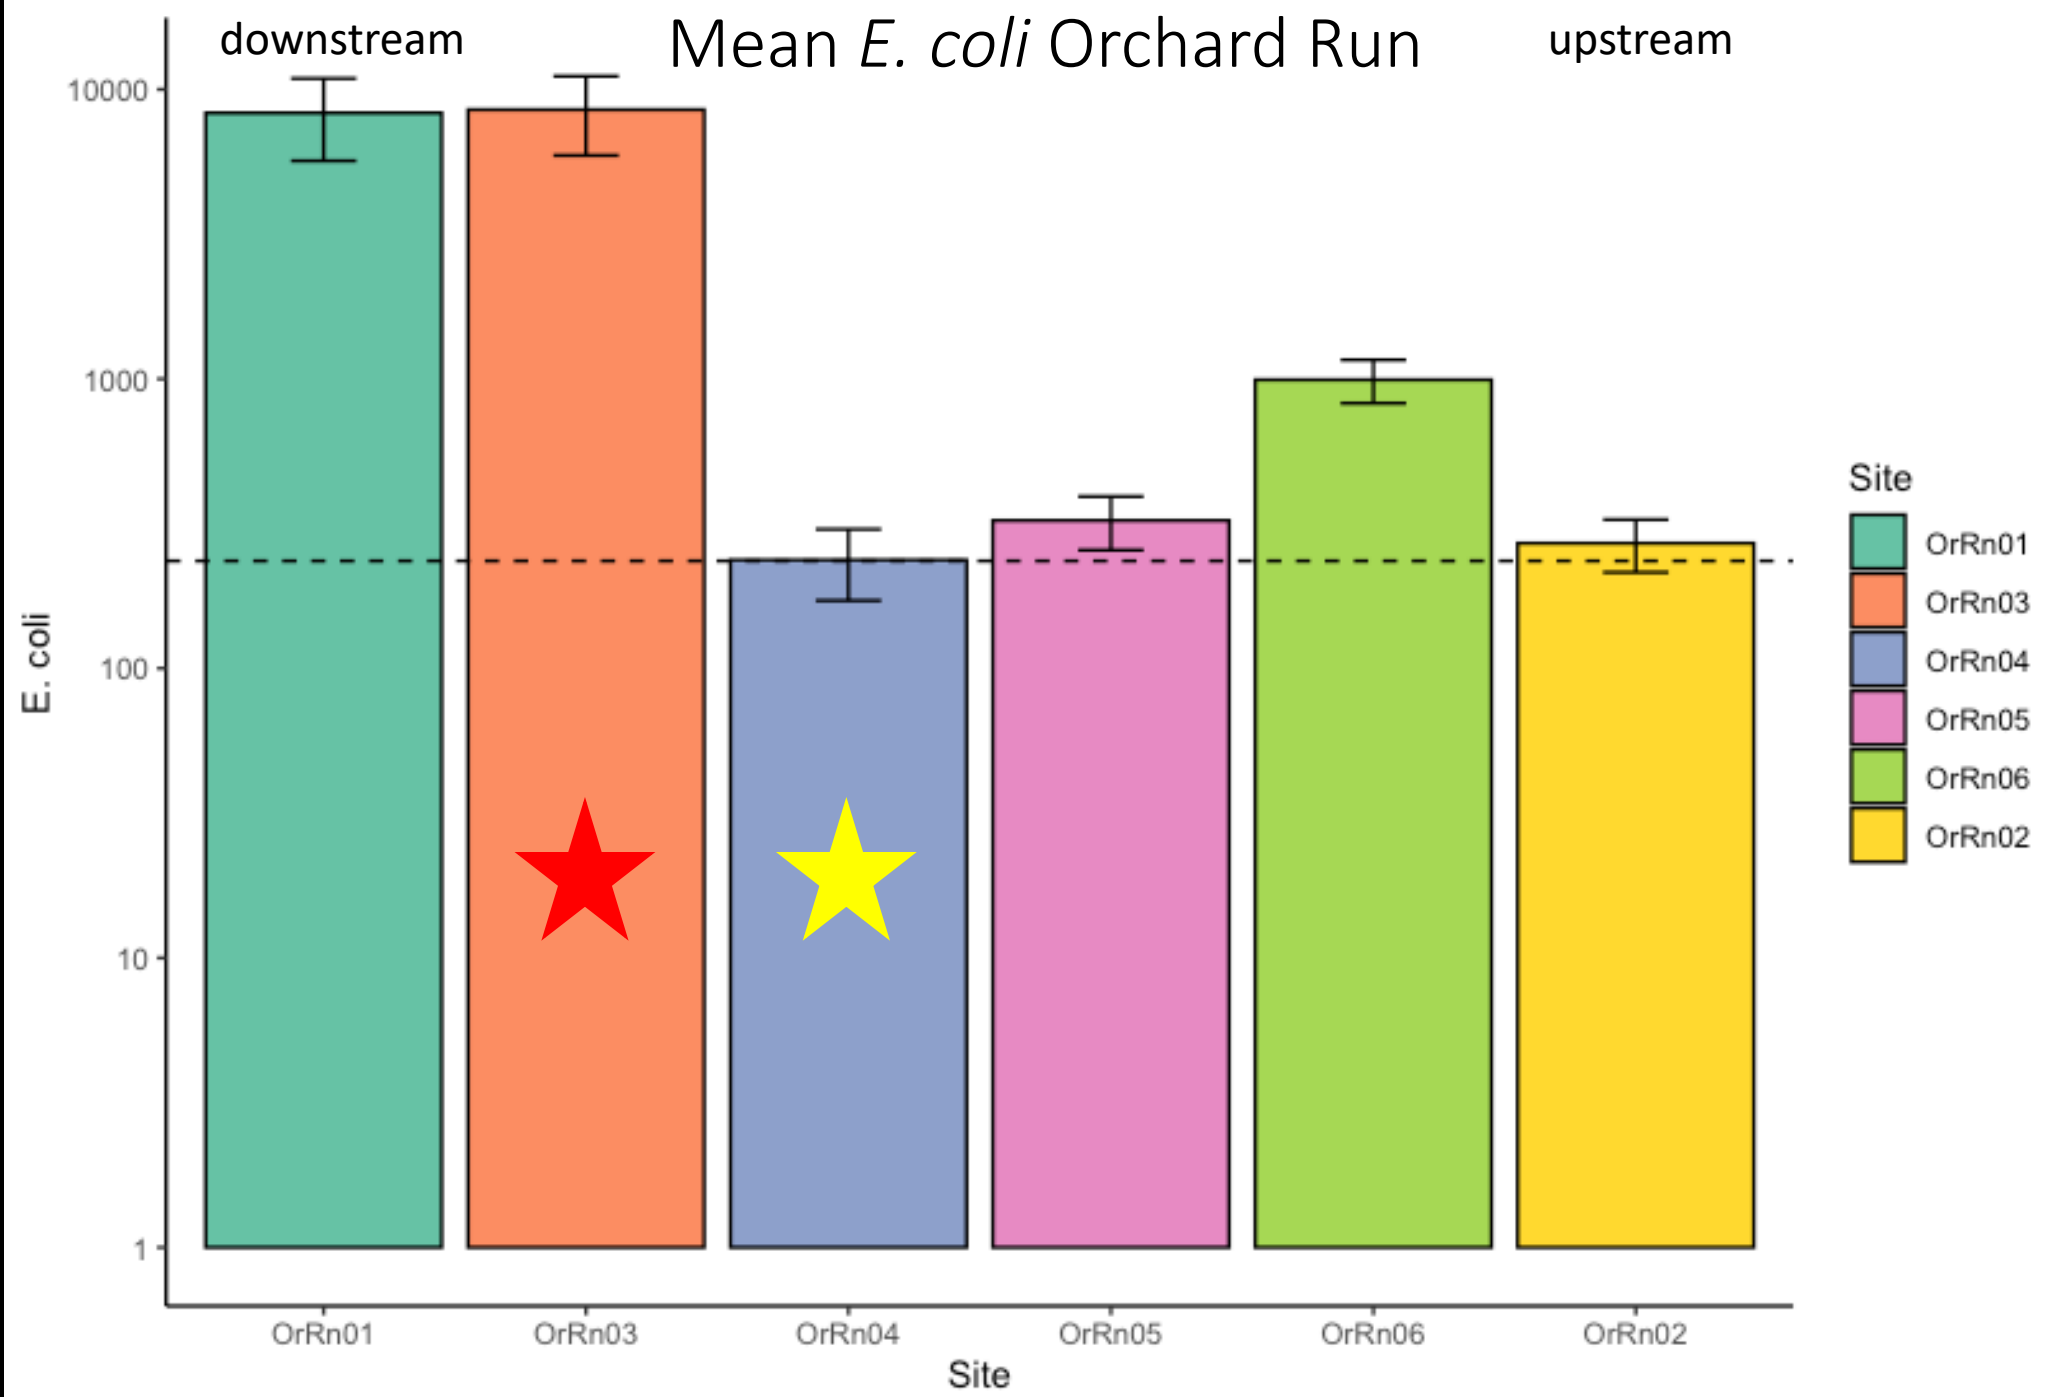

# Orchard Run sites

- 6 sampling sites
- October 2023 – November 2023
- 6 sampling points
- Sampled during dry weather conditions
  - After 72 hours of no rain

# Moving Forward

- Provided information to the WWPC
- Continue monitoring on other tributaries on Wheeling Creek

# Acknowledgments

- Wheeling Water Pollution Control Division
- 3RQ
- Dr. James Wood
